The Tsunami Hazard

The Shoalwater Bay Indian Reservation faces two types of tsunami hazard:

- Tsunamis from distant earthquakes on the Pacific rim, such as the 2011 magnitude 9.0 earthquake near Japan. This type is the most common. Because the waves arrive hours after the quake, they are less likely to cause loss of life, but may inflict damage.

- Local tsunamis caused by a M8.0 (or greater) earthquake on the Cascadia subduction zone. This type poses the greatest danger: catastrophic waves, much larger than those from a distant quake, will strike the coast within 25–30 minutes, causing loss of life and widespread damage to property.

Much has been done to improve our understanding of tsunami hazards, develop warning systems, and educate the public. If coastal communities are to reduce the impacts of future tsunamis, they need to know how tsunamis will affect their people, property, economy, and infrastructure.

Shoalwater Reservation’s Vulnerability

To support local tsunami planning efforts, the U.S. Geological Survey and the Washington Military Department Emergency Management Division assessed variations in exposure of 24 communities along Washington’s outer and Strait of Juan de Fuca coasts. They considered how much of a community’s developed land and how many of its residents, visitors, and businesses are within the tsunami hazard zone. They also considered what percentage this represented of the community’s total population and assets.

For example, the amount of the reservation’s developed land in the inundation zone is small when measured in square miles, but it represents 93% of the community’s developed area and is home to 86% of the Shoalwater Reservation’s population. The potential losses from a tsunami could be devastating to the community.

Table 1. Estimates of the Shoalwater Reservation’s population and other assets within the tsunami inundation zone. Economic data is derived from the year 2011; population numbers are based on the 2010 census.

The Most Vulnerable People

All people in the tsunami hazard zone are vulnerable to some extent, but some may be more vulnerable than others. Groups of concern include:

- Children under the age of five: They need direction and help to evacuate and are more likely to develop problems such as post-traumatic stress disorders after a tsunami.
- Adults over the age of 65: They are more likely to have health and mobility issues, to need special medical equipment, and to have limited resources to invest in recovery following a tsunami.
- Renters: Many may be less well prepared for disasters than homeowners and may also have fewer resources to invest in recovery.
- Visitors: Tourists and residents who are visiting public places, such as beaches, museums, medical facilities, grocery stores, and religious centers, may not be prepared for or understand how to respond to tsunami warnings.

Economic Impacts

- 93% of the Shoalwater Bay Reservation’s developed land and 100% of its businesses are located within the tsunami hazard zone, so a future event could devastate the local economy.
- A tsunami may damage economically and culturally important natural resources, such as oysters and other shellfish, salmon, and timber.
- Tourism is a key part of the region’s economy. Depending on the season, large numbers of visitors will need to be taught what to do and where to go if an earthquake and tsunami occur.

**ARE YOU READY?** When you’re prepared, you feel more in control and are better able to keep yourself and your family safe. How can you be ready?

- **KNOW WHETHER THE PLACES WHERE YOU LIVE, WORK, OR PLAY ARE IN THE TSUNAMI HAZARD ZONE.**
- **BE PREPARED WHEREVER YOU ARE.** Developing a plan and a disaster supply kit now can make a difference in how you survive.
