LANDSLIDES ARE ONE OF THE MOST COMMON AND DEVASTATING NATURAL HAZARDS IN THE PACIFIC NORTHWEST. THE DAMAGE THEY CAUSE IS ALMOST NEVER COVERED BY INSURANCE.
WHAT IS A LANDSLIDE?

A landslide is the downward slope movement of rock, soil, or debris. Debris flow, earth flow, rock fall, mudflow, mudslide, slide, and slump are also terms for landslide.

WHY SHOULD I CARE?

LANDSLIDES CAN TAKE HUMAN LIFE. HOWEVER, EVEN A FEW INCHES OF SLOPE MOVEMENT CAN DISRUPT SEPTIC, SEWER, AND WATER LINES AND CRACK FOUNDATIONS, SEVERELY DAMAGING OR DESTROYING YOUR HOME.

READ ON TO LEARN SEVERAL THINGS YOU CAN DO TO REDUCE YOUR RISK

www.dnr.wa.gov/geology
COMMON TYPES OF LANDSLIDES

Rotational slides occur when rock or earth is transported downslope along a curved surface. This type of landslide can be large and damaging.

Earthflows and debris flows are usually rapid, downward movements of mixtures of water, soil, rock and (or) debris. Flows often occur in either water-saturated slopes or where vegetation has been removed by fire or humans.
LANDSLIDES HAPPEN IN AREAS WITH STEEP SLOPES, AND ARE TYPICALLY TRIGGERED BY EVENTS LIKE THESE

WAVE OR STREAM EROSION BELOW BLUFFS

EARTHQUAKES

www.dnr.wa.gov/geology
Excavating the base of slopes
Overwatering
Runoff

Intense or prolonged rainfall and (or) rapid snowmelt
Saturated soil

Human activities

www.oregongeology.org
SIGNS OF LANDSLIDE ACTIVITY:

- Cracks in soil
- Tilted or bent trees
- Increased spring activity or newly wet ground
- Hummocky or uneven terrain
- Sagging or taut utility lines
- Sunken or broken road beds
- Movement of soil away from foundations
- Leaking or broken water pipes

IF YOU SUSPECT ACTIVE LANDSLIDE MOVEMENT:
EVACUATE AND CONTACT YOUR LOCAL FIRE, POLICE, EMERGENCY MANAGER, OR PUBLIC WORKS DEPARTMENT
THE PRESENCE OF A PREVIOUS LANDSLIDE IS ONE OF THE BIGGEST AND MOST OBVIOUS RISK FACTORS

- sagging or taut utility lines
- cracks in soil
- newly forming headscarp
- mid-slope benches
- wet slopes or springs
- leaking or broken water pipes
- gaps in soil at foundation
- 'sag' pond
WHY IS WATER IMPORTANT?

One cubic foot (7.5 gallons) of water weighs 62.3 lbs!

When water is added to a slope the weight increases the downward force, putting surrounding homes at risk.

Dry soil
grains touch, increasing soil strength

Wet soil
grains pushed apart reducing soil strength

REDUCE WATER ON SLOPES:

- Maintain healthy vegetation
- Use drought-resistant plantings
- Fix leaking plumbing immediately
- Direct downspout runoff well away from slopes
- Plant trees and shrubs, which uptake water more efficiently than lawns

www.dnr.wa.gov/geology
PLANT ROOTS ARE VITAL

Live tree roots strengthen slopes. After a tree is cut down, it takes between 5 and 8 years for the roots below to lose their strength.

MAINTAIN A BUFFER OF NATIVE PLANTS BETWEEN YOUR HOUSE AND THE EDGES OF STEEP SLOPES
THERE ARE ACTIONS YOU CAN TAKE AS A HOMEOWNER TO REDUCE THE CHANCES OF A LANDSLIDE AFFECTING YOUR PROPERTY:

**DO**

- Drain water from surface runoff, downspouts, and driveways well away from slopes
- Plant native ground cover on slopes
- Consult with a professional before significantly altering existing slopes uphill or downslope of your home
- If you suspect you are on a landslide, contact a licensed engineering geologist or a geotechnical engineer for an evaluation
- Check online maps, such as SLIDO (Oregon) or the Washington Geologic Information Portal to see if you might live in a landslide area

**DO NOT**

- Do not add water to steep slopes
- Avoid placing fill soil on or near steep slopes
- Avoid placing yard waste or debris on steep slopes
- Avoid excavating on or at the base of steep slopes

YOU AND YOUR NEIGHBORS SHARE MORE THAN FENCES. YOU ALL SHARE THE RESPONSIBILITY OF KEEPING YOUR SLOPES SAFE.
If you live on or near a steep slope, evaluate your property for signs of landslide movement. Many (but not all) signs of landslide activity are listed below. A high score may indicate the presence of a landslide.

**INSIDE YOUR HOME:**

- Cracks in walls
- Nails popping out of walls
- Bulging walls
- Separation of chimney from walls
- Creaking/popping noises
- Light switches coming out of walls
- Doors/windows hard to shut
- Twisted beams
- Cracks in floors
- Water seeping into basement

**OUTSIDE YOUR HOME:**

- Changes in surface drainage
- Bulges in retaining walls or tilting of walls
- Cracks developing in the soil
- Pistol-butted or bent trees
- Broken water, utility, or sewer lines
- Cracks in sidewalks or foundation
- Stretched or leaning utility lines

**CONSULT A PROFESSIONAL BEFORE PURCHASING PROPERTY IN SLOPING AREAS**
IF YOU ARE IMPACTED BY OR

- Evacuate
- Contact your local fire, police, emergency manager, or public works department
- Contact a licensed professional

This pamphlet offers some general guidance a homeowner should consider regarding their home and property. Landslide conditions vary from site to site—if you are concerned about your property, it is always best to consult a professional.
